Profile

I am a game programmer working in C++ and C#, mainly in Unreal Engine, Unity, and custom engine code. I am looking for a 40-week internship from 1 February 2027, with a chance to continue into employment. I care about gameplay systems, AI, tools, and graphics.

Projects**Telemetry Plugin — Unreal Engine 5, C++**

Eight-week collaboration with an AA studio on an undisclosed title. I turned the telemetry work into a reusable Unreal plugin so it could be dropped into other projects. I added automatic actor tracking from project settings, a designer-friendly setup, and a playtest dog AI that wrote into the same telemetry log.

USS Calliope — Unity, C#

Eight-week action RPG made by a five-person team using Agile. I owned combat: data-driven weapons, ammo, hit chance, ballistic spray, and combat feedback. I also built player audio, animation, and a custom editor window for assets.

The Unseen — Unreal Engine 5, C++

Psychological puzzle game. I built a node-based interaction system (board, nodes, and links) and a dynamic weather system with Niagara rain. I also wrote a compile-time debug utility using variadic templates, stripped from shipping builds.

Unity AI Behavior Framework — Unity, C#

Ongoing personal project bringing Unreal-style AI into Unity: blackboards, behavior trees, and custom nodes. Simple agent behavior currently runs at 5,000 NavMeshAgents at 60 fps.

Melon Engine — C++, Vulkan

Ongoing personal engine. Win32 for windows and events, Vulkan and VMA for rendering, plus an arena allocator, job system, math, and ImGui. There is also an FFI bridge so renderer code can be written in Rust or C++.

Native Math Library and Pong — Unity and C++

Pong without Unity's built-in vectors. A custom C++ math library is loaded as a DLL, with zero-copy structs on the C# side. Collision and reflection run in C++.

Mojo Picon — C++, Raylib

Solo project from a graphics and engine course. A self-contained C++ game with a screen state machine, collisions, resource handling, swarming AI, and save/load.

Education

Forsbergs Skola, Game Programming
Stockholm, Sweden, 2025–2027

Two-year vocational program. Gameplay programming, engine development, AI, multiplayer networking, backend, and team production.

Skills

C++, C#, C. Unreal Engine 5, Unity, Vulkan, Win32, Raylib, CMake, Git. Gameplay systems, combat, AI and behavior trees, data-driven design, plugins and tools.
